AI Project Proposal

Project Title: *HeartGuard: A Single-Agent AI System for Predicting Heart Disease Risk using Artificial Neural Networks*

FAST NUCES, Karachi
Department of Computer Science
Date: 15 February 2026

TEAM MEMBERs:

Madiha Aslam K23-0846

Zain Saqib K23-0588

Introduction

Heart disease is one of the leading causes of death worldwide. Early detection and prediction of heart disease risk can help individuals take preventive measures and receive timely medical attention. Medical professionals analyze multiple parameters such as blood pressure, cholesterol level, age, and heart rate to assess risk. However, manually analyzing large amounts of patient data can be difficult and may not reveal complex patterns.

Artificial Intelligence (AI), particularly Artificial Neural Networks (ANNs), can analyze complex relationships in medical data and identify patterns that may not be obvious through manual analysis. This project proposes the development of a single intelligent AI agent that uses an ANN model to predict the risk of heart disease based on patient medical data.

The system will act as a healthcare prediction agent capable of receiving medical input and providing risk predictions, demonstrating how AI agents can assist in healthcare decision support.

Problem Statement

Heart disease diagnosis requires analyzing multiple medical parameters, which can be time-consuming and complex. Human analysis may miss hidden relationships between variables, leading to inaccurate or delayed detection.

There is a need for an intelligent AI-based system that can automatically analyze patient medical data and accurately predict heart disease risk, helping support early detection and improving healthcare decision-making.

Objectives

Primary Objectives

- Develop a single AI agent capable of predicting heart disease risk.
- Implement an Artificial Neural Network model for classification.

- Train the ANN using a real-world medical dataset.
- Enable the agent to predict heart disease risk based on user input.

Secondary Objectives

- Perform data preprocessing and normalization.
- Evaluate model performance using accuracy and confusion matrix.
- Integrate the trained model into an intelligent agent.
- Demonstrate AI agent decision-making capability in a healthcare scenario.

Dataset

This project will use the Heart Disease dataset from the UCI Machine Learning Repository.

The dataset includes the following attributes:

- Age
- Sex
- Chest pain type
- Resting blood pressure
- Cholesterol level
- Fasting blood sugar
- Maximum heart rate achieved
- ECG results
- Exercise induced angina

Output:

- 0 → No heart disease
- 1 → Heart disease present

This dataset will be used to train and test the Artificial Neural Network model.

Methodology

The project will follow these steps:

Step 1: Data Collection

The dataset will be loaded into the system using Python in Google Colab.

Step 2: Data Preprocessing

- Handle missing values
- Normalize feature values
- Split data into training and testing sets

Step 3: ANN Model Development

- Create an Artificial Neural Network using TensorFlow/Keras
- Input layer will receive patient medical features
- Hidden layers will learn patterns
- Output layer will predict heart disease risk

Step 4: Model Training

- Train the ANN using training data
- Optimize model performance

Step 5: Model Evaluation

- Measure accuracy
- Generate confusion matrix
- Analyze prediction performance

Step 6: Agent Integration

The trained ANN model will be integrated into a single intelligent agent that:

- Accepts patient input
- Processes data
- Predicts heart disease risk
- Displays prediction result

System Architecture

The system consists of the following components:

1. Input Layer
   Patient medical data is provided as input.

2. Preprocessing Layer
   Data is cleaned, normalized, and prepared.

3. ANN Model Layer
   Artificial Neural Network processes the data and learns patterns.

4. Agent Layer
   The intelligent agent uses the trained model to make predictions.

5. Output Layer
   The system displays heart disease prediction result.

Technology Stack

Programming Language:
Python

Development Platform:
Google Colab

Libraries and Frameworks:
TensorFlow / Keras
NumPy
Pandas
Matplotlib
Scikit-learn

Dataset Source:
UCI Machine Learning Repository

Expected Outcomes

The proposed system will:

- Predict heart disease risk using Artificial Neural Networks
- Function as a single intelligent AI agent
- Demonstrate AI-based healthcare prediction
- Achieve reliable prediction accuracy
- Provide automated decision support based on medical data

Applications

- Healthcare decision support systems

- Disease risk prediction systems
- Medical research and analysis
- AI-based healthcare assistants
- Educational demonstration of AI agents

Tools, Resources, and Environment

The project will be developed and executed using Google Colab, which provides a cloud-based environment for Python programming and machine learning.

The following tools and resources will be used:

- Google Colab for development and model training
- Python programming language
- TensorFlow and Keras for building the Artificial Neural Network
- Pandas and NumPy for data handling and preprocessing
- Matplotlib for visualization
- Scikit-learn for data splitting and evaluation
- UCI Machine Learning Repository dataset

Google Colab allows easy implementation, training, and testing of machine learning models without requiring high-performance local hardware.

Conclusion

This project proposes the development of a single-agent AI system using Artificial Neural Networks to predict heart disease risk. The system will demonstrate how AI agents can analyze medical data and provide accurate predictions. The project will provide practical experience in

neural networks, intelligent agents, and healthcare AI applications, while showing the potential of AI in supporting medical decision-making.
